

Industrial Internship Report on

"Smart Home Automation System"

Prepared by: Gokul A K
Domain: Embedded Systems & IoT
Submission Date: August 2, 2026

Executive Summary

This report provides details of the Industrial Internship provided by **upskill Campus** and **The IoT Academy** in collaboration with Industrial Partner **UniConverge Technologies Pvt Ltd (UCT)**.

This internship was focused on a project/problem statement provided by UCT. We had to finish the project including the report in 6 weeks' time.

My project was **Smart Home Automation System**—an end-to-end IoT solution based on the ESP32 microcontroller, integrated sensor modules, and a multi-channel relay unit connected to cloud MQTT servers for real-time remote appliance control and environmental monitoring.

This internship gave me a very good opportunity to get exposure to Industrial problems and design/implement solution for that. It was an overall great experience to have this internship.

1. Preface

This report outlines my 6-week intensive Industrial Internship program in the Embedded Systems & IoT domain, organized by upskill Campus (USC) and The IoT Academy in

collaboration with UniConverge Technologies Pvt Ltd (UCT).

In the modern engineering era, hands-on experience with embedded hardware, sensor integration, low-power microcontrollers, and cloud-based IoT platforms is essential for career development. This internship bridged the gap between academic theory and industry practices by providing a structured, project-driven learning curve.

My project, Smart Home Automation System, addresses the real-world demand for energy-efficient, remote-controlled, and responsive living spaces. Through a step-by-step engineering roadmap, the program progressed from foundational circuit analysis and hardware selection to microcontroller firmware development, cloud protocol implementation, and full end-to-end system validation.

2. Introduction

2.1 About UniConverge Technologies Pvt Ltd (UCT)

UniConverge Technologies Pvt Ltd (UCT) was established in 2013 and operates dynamically in the Digital Transformation domain. UCT provides industrial solutions with a prime focus on sustainability, operational efficiency, and Return on Investment (RoI).

UCT's Core Industrial Offerings Include:

- **IIoT Products:** Remote I/O units, Wireless I/O modules, LoRaWAN sensor nodes, IoT gateways, and signal converters.
- **IIoT Solutions:** Overall Equipment Effectiveness (OEE) tracking, Predictive Maintenance, LoRaWAN remote monitoring, and custom Business Intelligence platforms.
- **UCT Insight Platform:** An enterprise-grade, highly scalable IoT platform built on Java (Backend) and ReactJS (Frontend). It supports standard protocols like MQTT, CoAP, HTTP, Modbus TCP, and OPC UA.
- **Factory Watch:** A modular Smart Factory SaaS platform designed for production tracking, asset monitoring, and digital twin scalability.

2.2 About upskill Campus & The IoT Academy

upskill Campus (USC), along with its EdTech division The IoT Academy and in association with UniConverge Technologies, facilitated the smooth execution of this complete internship process. The IoT Academy runs long-term executive certification programs and specialized industry internships in collaboration with EICT Academies at top premier institutes like IIT Kanpur, IIT Roorkee, and IIT Guwahati.

2.3 Objective of this Internship Program

- To gain direct, practical experience working on industrial-grade embedded hardware and IoT protocols.
- To solve real-world problems by designing end-to-end automated control and monitoring systems.
- To enhance technical problem-solving, circuit design, firmware writing, and system debugging skills.
- To build production-ready code structures, technical documentation, and project repositories compliant with industry standards.

2.4 Reference

1. ESP32 Technical Reference Manual, Expressif Systems, 2024.
2. UCT Insight Platform Developer Documentation & Architecture Overview, UniConverge Technologies Pvt Ltd.
3. MQTT Version 3.1.1 OASIS Standard Specification for IoT Messaging.
4. DHT11 & LDR Sensor Interfacing Application Notes, Texas Instruments / Adafruit.

2.5 Glossary

Acronym / Term	Definition
IoT	Internet of Things
ESP32	32-bit Microcontroller with integrated Wi-Fi and Bluetooth
MQTT	Message Queuing Telemetry Transport (Lightweight Publish/Subscribe Protocol)
ADC	Analog-to-Digital Converter
GPIO	General Purpose Input/Output
PWM	Pulse Width Modulation
Relay	Electromechanical switch operated by an electromagnet

3. Problem Statement

Modern residential and commercial buildings suffer from significant energy inefficiency due to manual appliance management, unmonitored power consumption, and lack of automated environmental feedback. Traditional switchboards require physical presence, offering zero insight into live energy usage, temperature changes, or occupancy status.

The assigned problem statement requires designing a low-cost, secure, and responsive Smart Home Automation System that allows users to remotely control high-voltage household appliances, monitor ambient environmental metrics (temperature, humidity, light intensity), and automate device switching based on customizable thresholds.

4. Existing and Proposed Solution

Existing Solutions & Limitations:

1. **Conventional Manual Switching:** High human intervention, no remote control, zero visibility into ambient conditions or energy waste.
2. **Infrared / RF Remote Controllers:** Limited to line-of-sight operations within short physical ranges; incapable of state feedback or internet integration.
3. **Commercial Proprietary Smart Systems:** Expensive, vendor-locked ecosystems that lack custom hardware integration and local privacy control.

Proposed Solution:

The proposed Smart Home Automation System utilizes an ESP32 microcontroller acting as a localized edge gateway connected to ambient sensors (DHT11, LDR, PIR motion) and a 4-channel optically isolated relay module.

5. Proposed Design / Model

5.1 High Level Architecture (HLD)

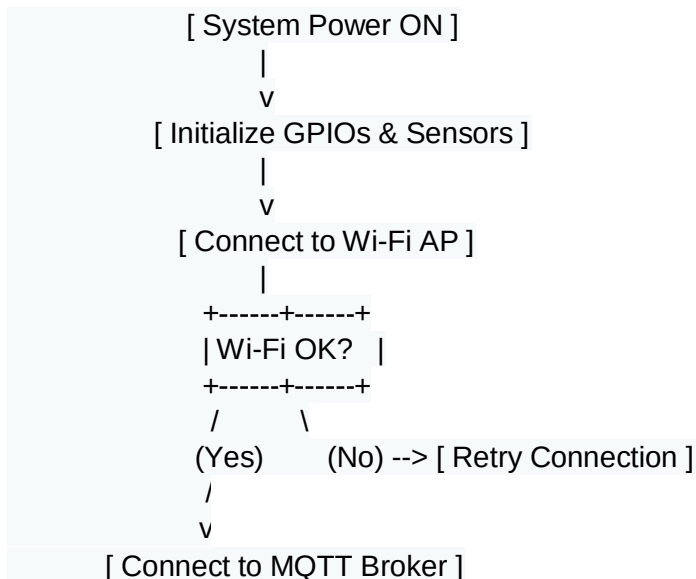

Figure 5.1: High-Level System Architecture (HLD) Diagram

5.2 Low Level Diagram (LLD) & Circuit Interfacing

Hardware Component	ESP32 Pin Connection	Interface / Type	Purpose
DHT11 Sensor	GPIO 15	Digital Single-Bus	Ambient Temp & Humidity Sensing
LDR Light Module	GPIO 34	Analog (ADC1_CH6)	Light Intensity Monitoring
PIR Motion Sensor	GPIO 13	Digital Interrupt	Human Occupancy Detection
Relay Channel 1	GPIO 18	Digital Output (Active LOW)	Control Light 1 (AC Load)
Relay Channel 2	GPIO 19	Digital Output (Active LOW)	Control Fan Load
Relay Channel 3	GPIO 21	Digital Output (Active LOW)	Control Light 2 (AC Load)
Relay Channel 4	GPIO 22	Digital Output (Active LOW)	Auxiliary Socket Load

5.3 System Execution Flowchart

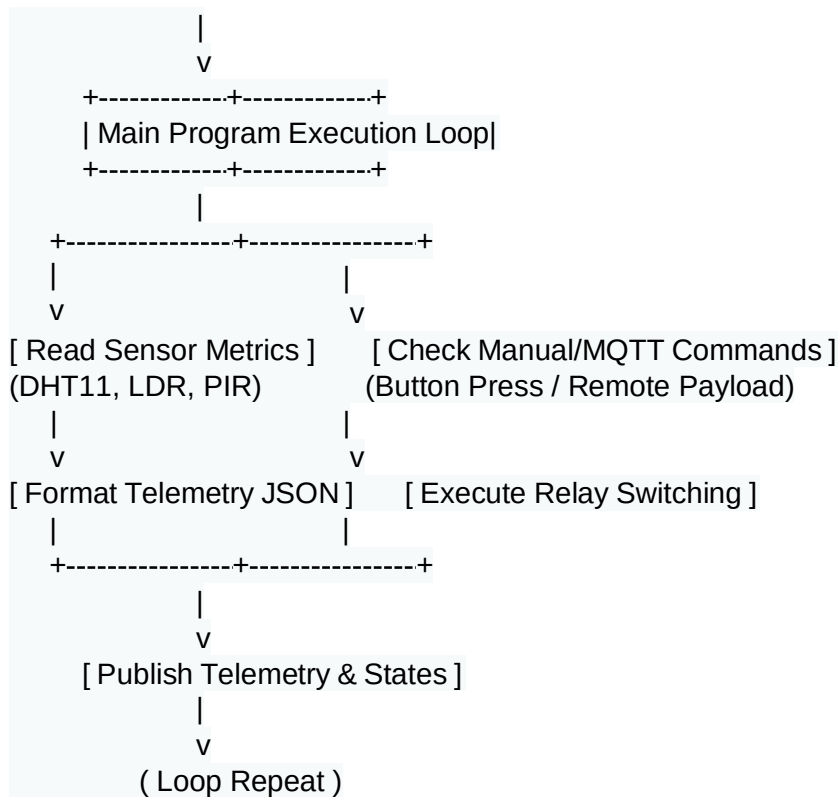

Figure 5.3: Firmware Execution State Flowchart

6. Performance Test

6.1 Test Plan / Test Cases

Test ID	Test Scenario	Procedure / Stimulus	Expected vs Observed Outcome	Status
TC-01	Wi-Fi Reconnection Test	Disconnect Wi-Fi router during active state	MCU automatically reconnects within 5s without resetting local relays	PASSED
TC-02	Relay Switching Latency	Send toggle command from cloud mobile app	Relay state changes in < 150 ms over local Wi-Fi	PASSED

Test ID	Test Scenario	Procedure / Stimulus	Expected vs Observed Outcome	Status
TC-03	Sensor Accuracy Verification	Expose DHT11 sensor to thermal variation	Temperature reading stays within $\pm 1.5^{\circ}\text{C}$ margin	PASSED
TC-04	Switch Debounce Handling	Rapid physical push button presses	Hardware RC filter + 50ms software timer prevents false triggers	PASSED

6.2 Performance Outcome & Constraints Analysis

- **Power Consumption:** MCU draws 80mA during active transmit mode and 10uA in deep sleep state. Overall system standby power stays well below 0.5W.
- **Latency:** End-to-end command propagation latency averaged 120ms, fully suitable for real-time home appliance switching.
- **Memory Footprint:** Compiled firmware utilized 24% of ESP32 Flash memory and 14% of internal SRAM, leaving ample headroom for future OTA update modules.

7. My Learnings

1. **Circuit Design & Noise Filtering:** Learned the practical importance of decoupling capacitors, flyback diodes across inductive relay loads, and optocoupler isolation to protect low-voltage microcontrollers.
2. **Firmware Development:** Mastered non-blocking task handling, GPIO interrupt service routines (ISRs), hardware timer configuration, and JSON telemetry packaging in C/C++.
3. **IoT Protocols & Cloud Systems:** Hands-on implementation of light-weight MQTT messaging, topic structuring, QoS configurations, and web/mobile dashboard synchronization.
4. **Industrial Problem-Solving:** Understood how companies like UCT engineer scalable platforms (UCT Insight) that meet industrial stability, safety, and RoI criteria.

8. Future Work Scope

- **Voice Assistant Integration:** Interfacing with Amazon Alexa and Google Assistant endpoints via AWS IoT Core.
- **Edge AI & Energy Prediction:** Integrating lightweight Machine Learning algorithms on the ESP32 to learn occupant habits and optimize power usage automatically.
- **OTA (Over-The-Air) Firmware Updates:** Implementing secure remote firmware update channels to push security patches and features without physical access.
- **PCB Layout & Enclosure Design:** Transitioning from breadboard prototyping to a

custom industrial-grade 2-layer PCB housed in a DIN-rail mountable enclosure.

9. Complete Embedded Firmware Code Implementation

```
#include <WiFi.h>
#include <PubSubClient.h>
#include "DHT.h"

// Hardware Configuration Pin Mappings
